## 1 API Documentation

For each API, we use POST to deliver form data, and use json for passing of data structures. The response is a json string.

### 1.1 User

#### 1.1.1 Register

POST /api/auth/register

##### 1. Form data

Name	Format	Description
username	string	The username of the user
password	string	The password of the user (or hash of the password)

##### 2. Response

Name	Format	Description
success	bool	Whether the register is success
uuid	string	The uuid of the user (only when success)
reason	string	Human readable reason of failure (when fail)

### 1.1.2 Login

POST /api/auth/login

1. Form data See POST /api/auth/register
2. Response 400 error when the username and/or password is not valid.

Name	Format	Description
uuid	string	The uuid of the user
expires	float	The timestamp when the session expires
token	string	The token of the session

## 1.2 Model

### 1.2.1 Parameters

1. Change POST /api/model/params

(a) Form data

Name	Format	Description
learning_rate	float	The target learning rate

(b) Response See GET /api/model/params

2. Get GET /api/model/params

(a) Response

Name	Format	Description
learning_rate	float	The changed (POST) or original (GET) learning rate

### 1.2.2 Forward

POST /api/model/forward

1. Form data

Name	Format	Description
x	int[]	The input data

2. Response See GET /api/model/output

### 1.2.3 Backward

GET /api/model/backward

1. Response See GET /api/model/output

### 1.2.4 Output

GET /api/model/output

1. Response

Name	Format	Description
A	int	The output data

### 1.2.5 Optimize

GET /api/model/optimize

Name	Format	Description
dW	int[][]	The gradient of W
dB	int	The gradient of B

### 1.2.6 Model

GET /api/model/model

1. Response

Name	Format	Description
W	int[][]	The weights matrix
B	int	The bias
